

Setting a Static IP address for Transmitters and Receivers

Below is the procedure on how provide additional stability to EVOIP transmitters and receivers when you are encountering multicast issues or when devices seem to randomly appear offline. Out of the box, each EVOIPCTL1 control box has a 169.254.x.x IP address. An additional IP address is often provided either DHCP from the network or a static IP address is manually provided. All transmitters communicate solely with the control box using the 169.254.x.x format, so the procedure below is based on maintaining this format and essentially taking the IP address automatically assigned by the control box and making is static.

If you have any further questions, please reach out to tech support at techsupport@vanco1.com or call 800-626-6445.

1. Find the 169.254.x.x IP address of the control box if it has been changed manually of via DHCP by the network. This can be done using a software like Advanced IP Scanner as shown below. While this is not entirely necessary, this does make the process faster in regards to making changes and confirming when a device is back online. Otherwise, you will have to continuously change the IPv4 setting of your computer to reach devices within the network.

Advanced IP Scanner

- Type in the IP address for the control box and enter your login information (admin/admin by default). Select the **SETUP** icon and you will see all of your EVOIP transmitters and receivers online. Locate the column that says **DEVICE IP**. This is where you locate the IP address of each EVOIP unit.

Group	Type	Model	Name	Device IP	MC. Addr	MAC Address	Status
64	RX	EVOIP	TV21	169.254.9.126	225.0.103.64	82:F7:5A:7B:7C:47	16 min, 11 sec

- Type in the IP address of the device you would like to make static into your browser and select the **Network** tab.

IP Setup

IP Mode:

- By default the units are set to Auto IP. Select **Static** and enter the network information. To allow for a faster setup, we recommend using the IP address that was provided and typed into the browser. Ensure the subnet is set to 255.255.0.0, and the gateway is set to the same setting found within the control box settings. In the case below this would be 10.0.0.100. Once this has been done, click **Apply**.

Default Gateway:

5. After a few moments, you will receive confirmation that the changes has been applied. After a few more moments, you will receive a message stating to reboot the unit.

1 **Success:** New IP mode (static) applied.

2 **Warning:** Reboot for new settings to take effect.

6. Once you receive the message to reboot, go to **System**, then **Utilities**, and select **Reboot**. After about 20-30 seconds the device will be back online.

The screenshot shows a web interface with a navigation bar at the top containing 'System', 'Video Wall', 'Network', and 'Functions'. The 'System' tab is selected. Below the navigation bar, there are three expandable sections: 'Version Information', 'Update Firmware', and 'Utilities'. The 'Utilities' section is expanded, revealing a 'Commands' area with two buttons: 'Factory Default' and 'Reboot'.
